FIREARMS SHIELD

The world class Firearms Shield was developed in the UK after close consultation with the UK Police and Firearms Team. The concept was to develop a ballistic shield which would provide protection in the kneeling position and at the same time enable the user to aim and fire from a semi-automatic weapon such as the MP5. The shield has rifle cuts on the same side to enable both left and right handed use. Ambidextrous handles satisfy this task.

The design and tactical use of the shield, enhanced by the specific training precludes the need for a view port. This makes the shield lighter. As the shield weighs substantially less than current shields on the market, 10 pounds opposed to 16 pounds for the lightest competitor, it has the advantage of not tiring the operator quickly and is very adaptable when utilized in different tactical situations such as casualty evacuation in a hot zone, dynamic entry to save life, active shooters, hostage situations, domestic situations and routine patrol work where the officer approaches a potentially lethal situation.

Most, if not all shields on the market require a two handed method of control. The **Firearms Shield** is designed to allow the operator to use both hands with a long arm and provides a stable shooting platform for use with a handgun. The unique design has a weapon rest incorporated into the shield, which is ambidextrous so that left or right handed operators can use the same shield quickly and without any need to change handle positions.

To use a handgun with most shields the operator bends their arm around in front of the shield and cants the weapon over to allow the operator to view the weapon through the viewport. With this system the operator uses the weapon rest to steady their shooting position and this improves their accuracy.

Ballistic protection:

The standard is NIJ Level IIIA, although other standards and levels can be provided.

Weight:

6kgs
